

SNOS458I - APRIL 2000 - REVISED JUNE 2016

LMV7219

## LMV7219 7-ns 2.7-V to 5-V Comparator with Rail-to-Rail Output

#### **Features**

- $(V_S = 5 \text{ V}, T_A = 25^{\circ}\text{C}, \text{Typical Values Unless})$
- Propagation Delay 7 ns
- Low Supply Current 1.1 mA
- Input Common Mode Voltage Range Extends 200 mv Below Ground
- Ideal for 2.7-V and 5-V Single Supply Applications
- Internal Hysteresis Ensures Clean Switching
- Fast Rise and Fall Time 1.3 ns
- Available in Space-saving Packages: SC-70 and SOT-23
- Supports 105°C PCB Temperature

## **Applications**

- Portable and Battery-powered Systems
- Scanners
- Set Top Boxes
- High Speed Differential Line Receiver
- Window Comparators
- Zero-crossing Detectors
- **High-speed Sampling Circuits**

## 3 Description

The LMV7219 is a low-power, high-speed comparator with internal hysteresis. The LMV7219 operating voltage ranges from 2.7 V to 5 V with push-pull railto-rail output. This device achieves a 7-ns propagation delay while consuming only 1.1 mA of supply current at 5 V.

The LMV7219 inputs have a common mode voltage range that extends 200 mV below ground, allowing ground sensing. The internal hysteresis ensures clean output transitions even with slow-moving inputs signals.

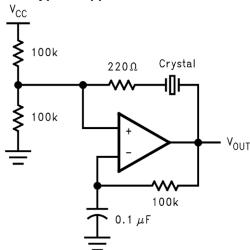

The LMV7219 is available in the SC-70 and SOT-23 packages, which are ideal for systems where small size and low power are critical.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)	
LMV7219	SC-70 (5)	2.00 mm × 1.25 mm	
	SOT-23 (5)	2.88 mm × 1.60 mm	

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Cł	nanges from Revision H (April 2016) to Revision I	Page
•	Added Supports 105°C PCB Temperature to Features List	1
•	Changed Operating Temperature to Ambient Temperature	4
•	Added Junction Temperature of 125 °C	4
•	Added PCB Temperature of 105 °C	4
<u>•</u>	Added T <sub>PCB</sub> ≤ 105°C throughout Electrical Tables	5
Cł	nanges from Revision G (January 2015) to Revision H	Page
•	Changed "Infrared or Convection (20 sec)" from 235 °C	4
<u>•</u>	Added thermal data for SOT23 and SC70 packages	4
Cl	nanges from Revision F (April 2013) to Revision G	Page
•	Added, updated, or renamed the following sections: Device Information Table, Pin Configurations and Functions; Specifications; Application and Implementation; Power Supply Recommendations; Layout, Device and Documentation Support, Mechanical, Packaging, and Ordering Information	1
<u>•</u>	Changed from "transient response" to "eliminate possible output chatter" in Circuit Layout and Bypassing	16
Cł	nanges from Revision E (March 2013) to Revision F	Page
•	Changed layout of National Data Sheet to TI format	1

## 5 Pin Configuration and Functions

**Pin Functions** 

PIN		I/O	DESCRIPTION
NUMBER	NAME	1/0	DESCRIPTION
1	OUT	0	Output
2	V-	1	Negative Supply
3	+IN	I	Non-inverting input
4	-IN	I	Inverting input
5	V <sup>+</sup>	I	Positive Supply

## 6 Specifications

#### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)(2)

		MIN	MAX	UNIT
Differential input voltage			± Supply Voltage	
Output short circuit duration			See <sup>(3)</sup>	
Supply voltage (V <sup>+</sup> - V <sup>-</sup> )			5.5	V
Soldering information	Infrared or Convection (20 sec)		260	
Soldering information	Wave Soldering (10 sec)		260 (lead temp)	°C
Voltage at input/output pins			(V <sup>+</sup> ) + 0.4 (V <sup>-</sup> ) - 0.4	V
Current at input pin (4)			±10	mA
Maximum junction temperature			150	°C
Storage temperature		-65	150	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (3) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of ±30mA over long term may adversely affect reliability.
- (4) Limiting input pin current is only necessary for input voltages that exceed absolute maximum input voltage ratings.

#### 6.2 ESD Ratings

			VALUE	UNIT
V	Electrostatic	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	±2000	V
V <sub>(ESD)</sub>	discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±150	V

<sup>(1)</sup> JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2000 V may actually have higher performance.

#### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltages (V <sup>+</sup> - V <sup>-</sup> )	2.7	5	V
Ambient Temperature <sup>(1)</sup>	-40	+85	°C
Junction Temperature		125	°C
PCB Temperature		105	°C

<sup>(1)</sup> The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> - T<sub>A</sub>)/R<sub>θJA</sub>. All numbers apply for packages soldered directly into a PC board.

#### 6.4 Thermal Information

0.4				
		LMV7219	LMV7219	
	THERMAL METRIC <sup>(1)</sup>	DBV (SOT23)	DCK (SC70)	UNIT
		5 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	209	296	°C/W
R <sub>0</sub> JC(top	Junction-to-case (top) thermal resistance	170	132	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	68	76	°C/W
ΨЈТ	Junction-to-top characterization parameter	52	8.6	°C/W

 For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

<sup>(2)</sup> JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions. Pins listed as ±150 V may actually have higher performance.

## 7 Detailed Description

#### 7.1 Overview

LMV7219 is a single supply comparator with internal hysteresis, 7 ns of propagation delay and only 1.1 mA of supply current.

The LMV7219 has a typical input common mode voltage range of -0.2 V below the ground to 1 V below  $V_{cc}$ . The differential input stage is a pair of PNP transistors, therefore, the input bias current flows out of the device. If either of the input signals falls below the negative common mode limit, the parasitic PN junction formed by the substrate and the base of the PNP will turn on, resulting in an increase of input bias current.

#### 7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

#### 7.3 Feature Description

If one of the inputs goes above the positive common mode limit, the output will still maintain the correct logic level as long as the other input stays within the common mode range. However, the propagation delay will increase. When both inputs are outside the common mode voltage range, current saturation occurs in the input stage, and the output becomes unpredictable.

#### 7.4 Device Functional Modes

The propagation delay does not increase significantly with large differential input voltages. However, large differential voltages greater than the supply voltage should be avoided to prevent damages to the input stage.

The LMV7219 has a push-pull output. When the output switches, there is a direct path between  $V_{CC}$  and ground, causing high output sinking or sourcing current during the transition. After the transition, the output current decreases and the supply current settles back to about 1.1 mA at 5 V, thus conserving power consumption.

Most high-speed comparators oscillate when the voltage of one of the inputs is close to or equal to the voltage on the other input due to noise or undesirable feedback. The LMV7219 has 7 mV of internal hysteresis to counter parasitic effects and noise. The hysteresis does not change significantly with the supply voltages and the common mode input voltages as reflected in the specification table.

## 8 Application and Implementation

#### NOTE

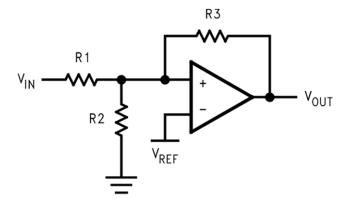

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 8.1 Application Information

The following section explains in detail how to manipulate the hysteresis voltage of the LMV7219. Detailed expressions are provided along with practical considerations for designing hysteresis.

## 8.2 Typical Application

Figure 14 shows the typical method of adding external hysteresis to a comparator. The positive feedback is responsible for shifting the comparator trip point depending on the state of the output.

Copyright © 2016, Texas Instruments Incorporated

Figure 14. Additional Hysteresis

#### 8.2.1 Design Requirements

The internal hysteresis creates two trip points, one for the rising input voltage and one for the falling input voltage, as shown in Figure 19. The difference between the trip points is the hysteresis. With internal hysteresis, when the comparator's input voltages are equal, the hysteresis effectively causes one comparator-input voltage to move quickly past the other, thus taking the input out of the region where oscillation occurs. Standard comparators require hysteresis to be added with external resistors. The fixed internal hysteresis eliminates these resistors.

#### 8.2.2 Detailed Design Procedure

#### 8.2.2.1 Additional Hysteresis

If additional hysteresis is desired, this can be done with the addition of three resistors using positive feedback, as shown in Figure 14. The positive feedback method slows the comparator response time. Calculate the resistor values as follows:

1. Select R3. The current through R3 should be greater than the input bias current to minimize errors. The current through R3 ( $I_F$ ) at the trip point is ( $V_{REF}$  -  $V_{OUT}$ ) /R3. Consider the two possible output states when solving for R3, and use the smaller of the two resulting resistor values. The two formulas are:

$$R3 = V_{RFF}/I_{F} \tag{1}$$

When  $V_{OUT} = 0$ :

## **Typical Application (continued)**

$$R3 = V_{CC} - V_{REF} / I_F$$
 (2)

When  $V_{OUT} = V_{CC}$ :

- 2. Choose a hysteresis band required (V<sub>HR</sub>).
- 3. Calculate R1, where R1 = R3  $X(V_{HB}/V_{CC})$
- 4. Choose the trip point for  $V_{IN}$  rising. This is the threshold voltage ( $V_{THR}$ ) at which the comparator switches from low to high as  $V_{IN}$  rises about the trip point.
- 5. Calculate R2 as follows:

$$R_{2} = \frac{1}{\left(\frac{V_{THR}}{V_{REF} \times R_{1}}\right) - \frac{1}{R_{1}} - \frac{1}{R_{3}}}$$
(3)

6. Verify the trip voltage and hysteresis as follows:

$$V_{IN} \text{ rising: } V_{THR} = V_{REF} \times R_1 \times \left(\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}\right)$$

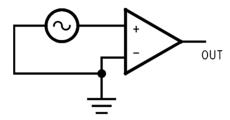

$$V_{IN} \text{ falling: } V_{THF} = V_{THR} - \left(\frac{R_1 \times V_{CC}}{R_3}\right)$$

$$Hysteresis = V_{THR} - V_{THF}$$
(4)

This method is recommended for additional hysteresis of up to a few hundred millivolts. Beyond that, the impedance of R3 is low enough to affect the bias string and adjustment of R1 may be also required.

#### 8.2.2.2 Zero-Crossing Detector

The inverting input is connected to ground and the non-inverting input is connected to 100mVp-p signal. As the signal at the non-inverting input crosses 0 V, the comparator's output Changes State.

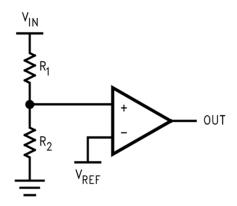

Copyright © 2016, Texas Instruments Incorporated

Figure 15. Zero-Crossing Detector

#### 8.2.2.3 Threshold Detector

Instead of tying the inverting input to 0 V, the inverting input can be tied to a reference voltage. The non-inverting input is connected to the input. As the input passes the  $V_{REF}$  threshold, the comparator's output changes state.

#### **Typical Application (continued)**

Figure 16. Threshold Detector

#### 8.2.2.4 Crystal Oscillator

A simple crystal oscillator using the LMV7219 is shown in Figure 17. Resistors R1 and R2 set the bias point at the comparator's non-inverting input. Resistors R3, R4 and C1 sets the inverting input node at an appropriate DC average level based on the output. The crystal's path provides resonant positive feedback and stable oscillation occurs. The output duty cycle for this circuit is roughly 50%, but it is affected by resistor tolerances and to a lesser extent by the comparator offset.

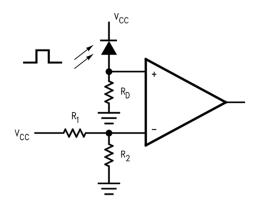

Figure 17. Crystal Oscillator

#### 8.2.2.5 IR Receiver

The LMV7219 is an ideal candidate to be used as an infrared receiver. The infrared photo diode creates a current relative to the amount of infrared light present. The current creates a voltage across RD. When this voltage level cross the voltage applied by the voltage divider to the inverting input, the output transitions.

## 9 Power Supply Recommendations

The LMV7219 can operate off a single supply or with dual supplies as long as the input CM voltage range ( $V_{CM}$ ) has the required headroom to the positive rail V+. The input range extends to slightly below V- voltage. Supplies should be decoupled with low inductance, often ceramic, capacitors to ground less than 0.5 inches from the device pins. The use of ground plane is recommended, and as in most high speed devices, it is advisable to remove ground plane close to device sensitive pins such as the inputs.

#### 10 Layout

#### 10.1 Layout Guidelines

#### 10.1.1 Circuit Layout and Bypassing

The LMV7219 requires high-speed layout. Follow these layout guidelines:

- 1. Power supply bypassing is critical, and will improve stability and eliminate possible output chatter. A decoupling capacitor such as 0.1-μF ceramic should be placed as close as possible to V<sup>+</sup> pin (and to V- pin if used with dual supplies) as shown in Figure 20. An additional 2.2-μF tantalum capacitor may be required for extra noise reduction.
- 2. Keep all leads short to reduce stray capacitance and lead inductance. It will also minimize unwanted parasitic feedback around the comparator.
- 3. The device should be soldered directly to the PC board instead of using a socket.
- 4. Use a PC board with a good, unbroken low inductance ground plane as shown in Figure 20. Make sure ground paths are low-impedance, especially were heavier currents are flowing.
- 5. Input traces should be kept away from output traces. This can be achieved by running a topside ground plane between the output and inputs.
- 6. Run the ground trace under the device up to the bypass capacitor to shield the inputs from the outputs.
- 7. To prevent parasitic feedback when input signals are slow-moving, a small capacitor of 1000 pF or less can be placed between the inputs. It can also help eliminate oscillations in the transition region. However, this capacitor can cause some degradation to t<sub>pd</sub> when the source impedance is low.

## 11 Device and Documentation Support

#### 11.1 Documentation Support

#### 11.1.1 Related Documentation

For related documentation, see the following:

- Absolute Maximum Ratings for Soldering (SNOA549)
- Semiconductor and IC Package Thermal Metrics (SPRA953)

#### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

## 11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

#### 11.4 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

## 11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

## **PACKAGE OPTION ADDENDUM**

www.ti.com 3-Aug-2023

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
